

In the Claims

1 (currently amended). A pump system for the ~~subcutaneous delivery~~ pumping of a liquid, having a pump module comprising:

a stator housing with a chamber,

a rotor rotatably and axially slidably received in the chamber and comprising a first axial extension having a liquid supply channel and a second axial extension having a liquid supply channel, the first and second axial extensions having different diameters, and

first and second sealing rings, mounted around the first and second axial extensions.

2 (previously presented). The pump system according to claim 1, wherein the first and second sealing rings are mounted at an oblique angle with respect to a plane perpendicular to an axis of rotation of the rotor.

3 (previously presented). The pump system according to claim 1, wherein the sealing rings are O-ring seals.

4 (previously presented). The pump system according to claim 1, wherein the liquid supply channels are in the form of axially extending grooves on the surface of the axial extensions.

5 (previously presented). The pump system according to claim 1, wherein the axial extensions extend from opposite sides of a body of the rotor.

6 (previously presented). The pump system according to claim 1, wherein the rotor comprises one or more permanent magnets mounted close to a radial periphery of a body of the rotor.

7 (previously presented). The pump system according to claim 1, further comprising magnetic induction coils mounted in a stator part and acting on one or more permanent magnets mounted in the rotor to function as a step motor.

8 (previously presented). The pump system according to claim 1, further comprising a position sensor mounted in a stator part for detecting an axial position of the rotor.

9 (previously presented). The pump system according to claim 1, further comprising a reservoir 10 containing a supply of liquid, the pump module being assembled to the reservoir and having an inlet in liquid communication with the reservoir.

10 (previously presented). The pump system according to claim 9, wherein the pump module is mounted on the reservoir and forms therewith a disposable liquid supply unit.

11 (previously presented). The pump system according to claim 1, further comprising an electronic control and communications module connected to magnetic induction coils for driving the rotor.

12 (previously presented). The pump system according to claim 11, wherein the electronic control and communications module comprises a RF transceiver for wireless communication with a user's display and control unit.

13 (previously presented). The pump system according to claim 1, wherein the rotor is primarily made of injected plastic material.

14 (previously presented). The pump system according to claim 13, wherein magnets are embedded by overmolding in a body portion of the rotor.

15 (previously presented). The pump system according to claim 1, wherein the stator housing is primarily made of injected plastic material.

16 (previously presented). The pump system according to claim 1, wherein the pump module comprises a RFID transponder storing information on calibration of the pump module related to the number of rotor revolutions as a function of the volume of liquid pumped.

17 (previously presented). The pump system according to claim 11, wherein the electronic control and communication module comprises a RFID reader for wireless communication with a RFID transponder mounted to a disposable liquid supply unit comprising the pump module.
